PROJECT REPORT

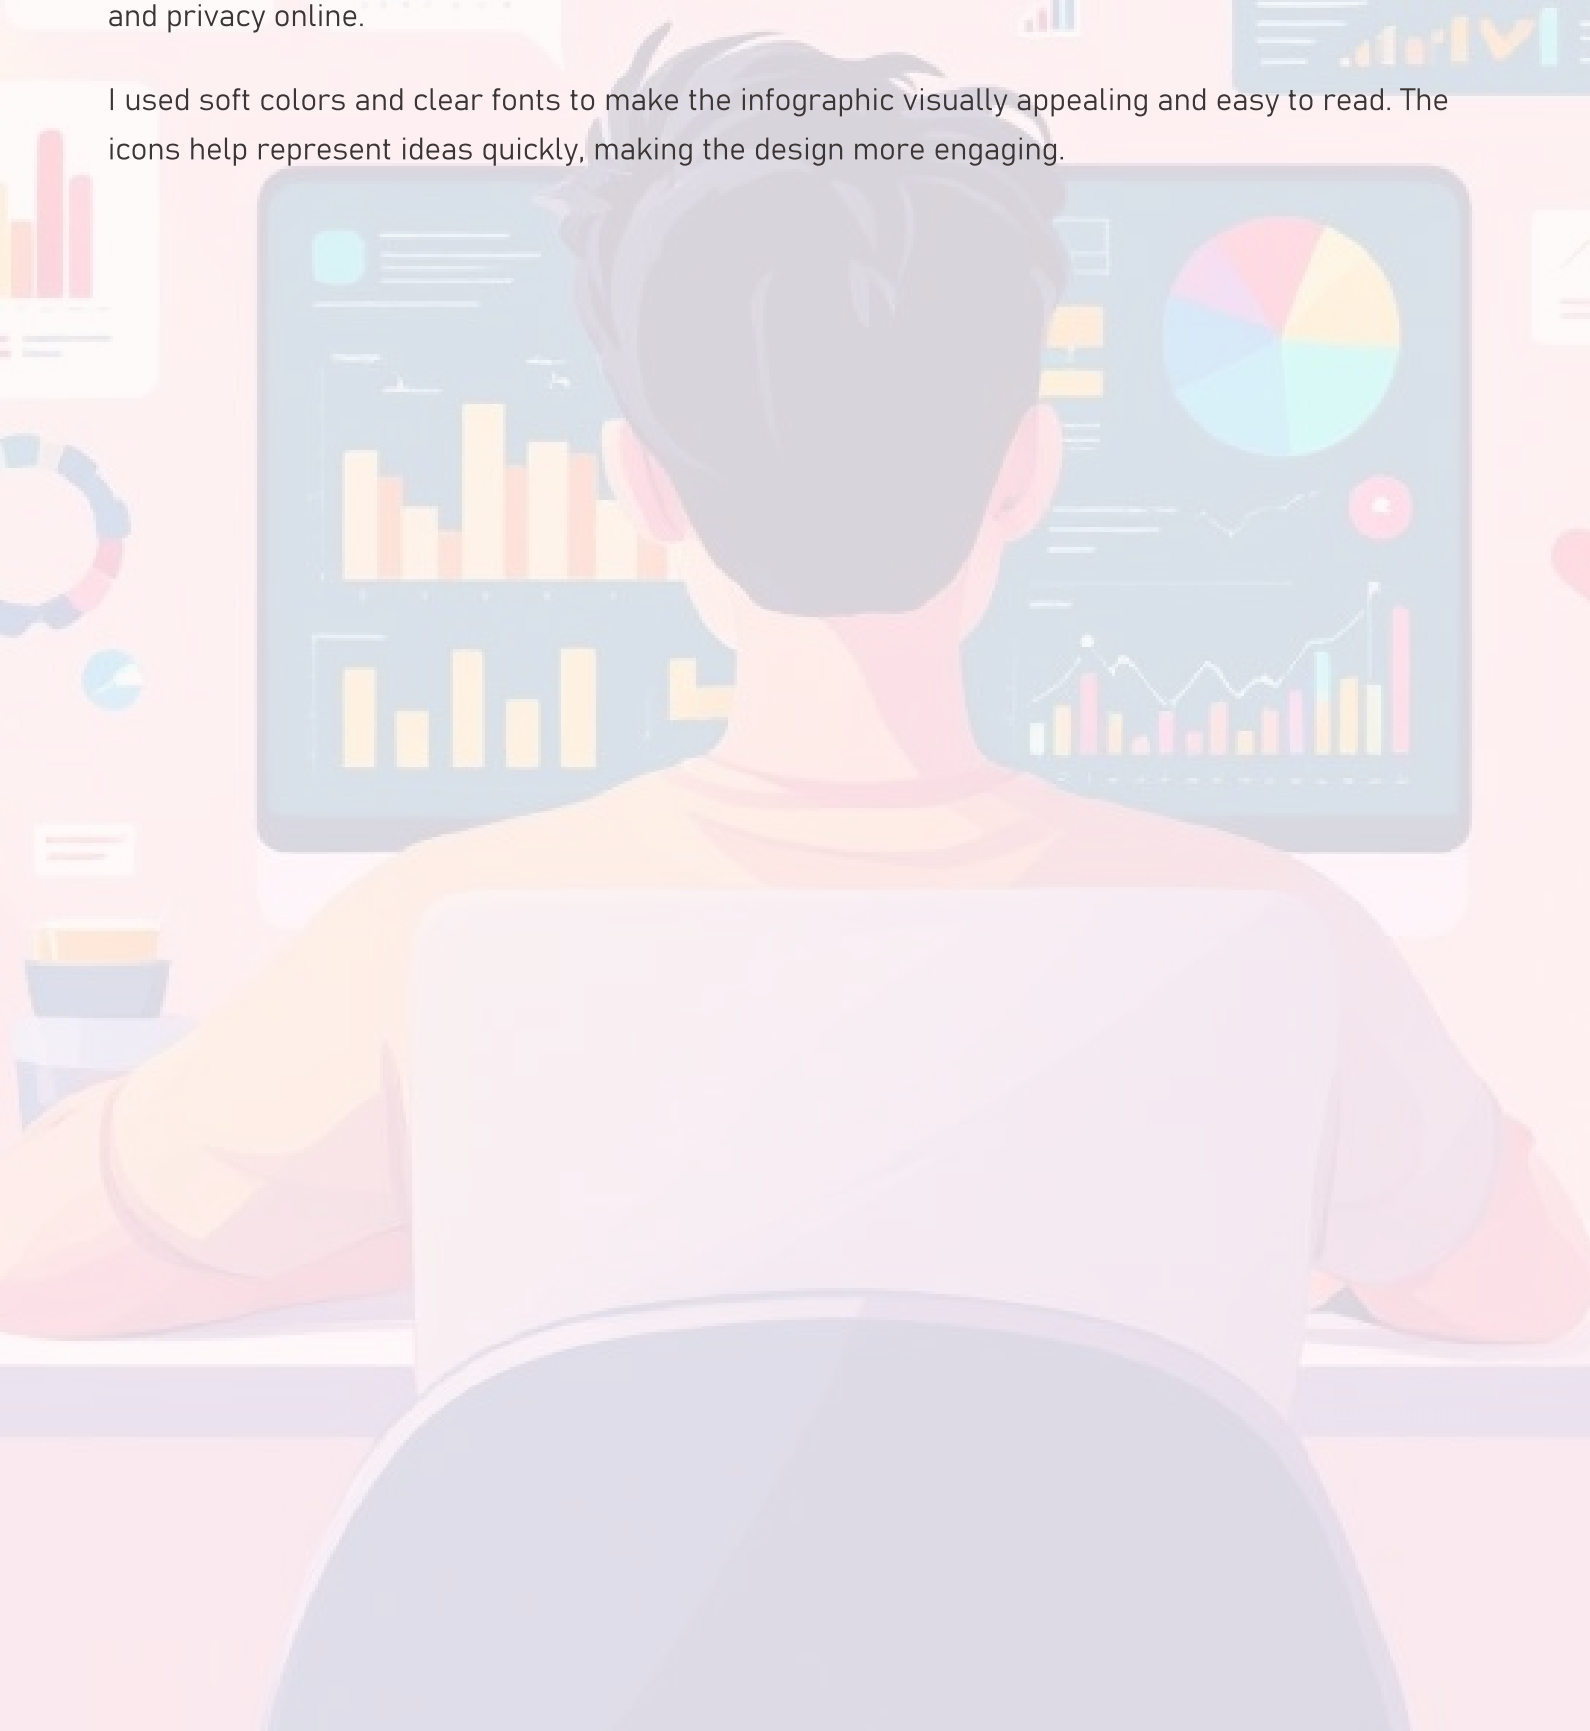
DIGITAL LITERACY

Name: Yash Srivastava
Registration No: 25BAI10932

Task 1

I created this infographic using **Canva**, which is a simple and user-friendly design tool. It allowed me to choose from templates, adjust colors, add icons, and arrange text neatly without needing advanced design skills. My design focuses on **digital literacy for students**. It explains what digital literacy means—understanding and using technology effectively. It also highlights useful digital tools like calendars, note-taking apps, and cloud storage, which help students stay organized and productive. Additionally, I included a section on **safe internet practices**, emphasizing the importance of protecting personal data and privacy online.

I used soft colors and clear fonts to make the infographic visually appealing and easy to read. The icons help represent ideas quickly, making the design more engaging.



Design Challenge: Balancing the Layout

> One thing I found challenging was **balancing the layout**—making sure the text, images, and spacing looked clean and not overcrowded. However, it was also interesting to experiment with different styles and see how small design changes could improve the overall look.

The Challenge

Balancing the layout—making sure the text, images, and spacing looked clean and not overcrowded.

The Discovery

It was interesting to experiment with different styles and see how small design changes could improve the overall look.

Task 2: Academic & Professional Platforms

For my project report, I chose LinkedIn, GitHub, and ResearchGate as the main platforms to support my academic and professional growth.

LinkedIn

Mainly used for building a professional profile, connecting with industry experts, and exploring internship and job opportunities.

GitHub

Used to store, manage, and showcase coding projects, helping me improve my programming skills and collaborate with others.

ResearchGate

Focused on sharing and exploring academic papers, which is useful for gaining deeper knowledge in technical and research-based topics.

Over the next four years, I plan to actively use LinkedIn to build a strong professional network and maintain an updated profile with my achievements. On GitHub, I will regularly upload projects, participate in open-source contributions, and create a strong portfolio. Through ResearchGate, I aim to follow research trends, read papers, and possibly publish my own work. Together, these platforms will help me grow academically, technically, and professionally.

Task 3 – Part B: HackerRank for Programming Skills

In this project, I used the platform **HackerRank** to improve my programming and problem-solving skills. HackerRank is an online platform that provides coding challenges in various domains such as algorithms, data structures, and mathematics. During this project, I practised solving different types of problems, ranging from basic syntax exercises to more complex logical questions. This helped me understand coding concepts more clearly and improve my speed and accuracy.

While practising, I also learned how to debug errors and think logically to approach a problem step by step. The platform provided instant feedback, which made it easier to identify mistakes and improve continuously.

Academic Benefit

Using HackerRank will greatly help me academically, especially in subjects related to computer science and programming. It strengthens my logical thinking, which is useful not only for coding but also for solving mathematical problems.

Future Impact

In the future, these skills will help me perform better in exams, participate in coding competitions, and prepare for technical interviews.

Overall Outcome

Overall, this platform has made learning more interactive and effective.

Task 4 – Part B: Poor Digital Communication in Group Projects

A real problem caused by poor digital communication can be seen in a group project scenario. One team member sent important instructions about the project deadline through a casual message in a group chat, but it was unclear and easily overlooked among other messages. As a result, two members misunderstood the deadline and submitted their work late, affecting the entire group's grade.

What Went Wrong

- Instructions sent through a casual group chat message
- Message was unclear and easily overlooked
- Two members misunderstood the deadline
- Work submitted late, affecting the entire group's grade

How It Could Have Been Avoided

- Instructions shared through email or a pinned message
- Proper details included: date, time, and expectations
- Confirming that all members had read and understood the message
- This would have reduced confusion and ensured timely submission

This situation could have been avoided with **clearer and more formal communication**.

Task 5 – Part B: Cybercrime Awareness

While researching cybercrime, what surprised me most was how simple tricks can fool even educated people. I didn't realize that something as basic as approving a UPI request or clicking a link could instantly lead to financial loss. The fact that fraudsters use psychological tactics like urgency, fear, or excitement made me understand that cybercrime is not just technical but also manipulative. It was also surprising how quickly money can be transferred and how difficult it is to recover once lost.

Key Realization

Cybercrime is not just technical but also **manipulative**—fraudsters use psychological tactics like urgency, fear, or excitement to fool even educated people.

Personal Habit Change

As a result, one habit I will personally change is being more cautious before taking any action online. I will always verify links, double-check payment requests, and never share sensitive details like OTP or UPI PIN. This awareness will help me stay safer in the digital world.
